Common Solutions to Typical SP Gupta Business Statistics Problems

Solving for Mean and Median

Problem: Calculate the mean and median from a frequency distribution table.

Solution Approach:

- Calculate the class midpoints.
- Multiply midpoints by frequencies to find the sum of (fx) .
- Use the formula for mean: $(\bar{x} = \frac{\sum fx}{\sum f})$.
- For median, find the cumulative frequency and locate the median class.
- Apply the median formula:

$$\text{Median} = L + \left(\frac{\frac{N}{2} - CF}{f} \right) \times h$$

where:

- (L) = lower boundary of median class,
- (N) = total frequency,
- (CF) = cumulative frequency before median class,
- (f) = frequency of median class,
- (h) = class size.

Calculating Correlation Coefficient

Problem: Determine the correlation between two variables.

Solution:

- Tabulate data points for variables X and Y.
 - Calculate sums: $(\sum x)$, $(\sum y)$, $(\sum xy)$, $(\sum x^2)$, $(\sum y^2)$.
 - Plug into the correlation coefficient formula.
 - Interpret the value:
- $(r \approx 1)$: strong positive correlation.
 - $(r \approx -1)$: strong negative correlation.
 - $(r \approx 0)$: no correlation.

Constructing Index Numbers

Problem: Calculate a price index number based on given data.

Solution:

- Choose an appropriate index formula (e.g., Laspeyres, Paasche, or Fisher).
- Organize data for base year and current year.
- Insert values into the formula.
- Calculate and interpret the index.

Utilizing Software and Tools for Effective Problem Solving

While manual calculations are essential for understanding concepts, leveraging software tools can significantly enhance accuracy and efficiency.
