\]

\[

$\text{O}_4 = 4 \times 16.00 \text{ g/mol} = 64.00 \text{ g/mol}$

\]

\[

$$\text{Molar mass of CuSO}_4 = 63.55 + 32.07 + 64.00 = 159.62 \text{ g/mol}$$

Quantitative chemical analysis involves determining the amount or concentration of a substance within a sample. Harris's approach to these exercises emphasizes practical application, often integrating titrimetric methods, gravimetric analysis, and spectrophotometry. These exercises are designed to develop a comprehensive understanding of analytical techniques, calculation methods, and common pitfalls encountered during chemical analysis.

Understanding the typical structure of Harris exercises is crucial. They usually involve:

- Preparing standard solutions
- Performing titrations or gravimetric procedures
- Calculating concentrations, molarities, or percentages
- Interpreting raw data to derive meaningful results

Common Types of Harris Quantitative Exercises and Their Solutions

- Titration-Based Exercises

Overview: These exercises focus on determining the concentration of an unknown solution through titration with a standard solution.

Typical Scenario:

"A 25.0 mL sample of an unknown acid is titrated with 0.1 M NaOH, requiring 30.0 mL to reach the equivalence point. Calculate the molarity of the unknown acid."

Solution Steps:

- Step 1: Calculate moles of NaOH used:

Moles of NaOH = Molarity × Volume (in liters)

$$= 0.1 \text{ mol/L} \times 0.030 \text{ L} = 0.003 \text{ mol}$$

- Step 2: Determine the mole ratio from the balanced chemical equation.

For example, if the acid is monoprotic (e.g., HCl):

Mole ratio = 1:1

- Step 3: Find the molarity of the acid:

Molarity of acid = Moles of acid / Volume of acid in liters

$$= 0.003 \text{ mol} / 0.025 \text{ L} = 0.12 \text{ mol/L}$$

Answer: The unknown acid has a molarity of 0.12 M.

- Gravimetric Analysis Exercises

Overview: These involve precipitation and weighing to determine the amount of a particular ion in a sample.

Typical Scenario:

"A 0.5 g sample of an unknown salt is digested and precipitated as barium sulfate. The precipitate weighs 1.2 g. Calculate the percentage of sulfate in the original sample."

Solution Steps:

- Step 1: Write the chemical equation:

- Step 2: Calculate moles of BaSO_4 :

Molar mass of BaSO_4 = 233.39 g/mol

$$\text{Moles of } \text{BaSO}_4 = 1.2 \text{ g} / 233.39 \text{ g/mol} = 0.00514 \text{ mol}$$

- Step 3: Since the molar ratio of sulfate to BaSO_4 is 1:1, moles of sulfate = 0.00514 mol.

- Step 4: Calculate mass of sulfate:

Molar mass of SO_4^{2-} = 96.06 g/mol

$$\text{Mass of sulfate} = 0.00514 \text{ mol} \times 96.06 \text{ g/mol} = 0.494 \text{ g}$$

- Step 5: Percentage of sulfate in the original sample:

$$= (0.494 \text{ g} / 0.5 \text{ g}) \times 100\% \approx 98.8\%$$

Answer: The sulfate content in the sample is approximately 98.8%.

- Spectrophotometric Analysis Exercises

Overview: These exercises involve measuring absorbance and calculating concentrations using Beer-Lambert Law.

Typical Scenario:

"A solution's absorbance at a specific wavelength is 0.750. Given a calibration curve where an absorbance of 0.500 corresponds to 2.0 mg/L, determine the concentration of the analyte."

Solution Steps:

- Step 1: Establish the proportionality:

Absorbance / Concentration = Constant (from calibration curve)

- Step 2: Calculate the concentration:

Concentration = (Measured Absorbance / Calibration Absorbance) × Known concentration

$$= (0.750 / 0.500) \times 2.0 \text{ mg/L} = 1.5 \times 2.0 \text{ mg/L} = 3.0 \text{ mg/L}$$

Answer: The concentration of the analyte is 3.0 mg/L.

What is Analysis?

Analysis, often referred to as mathematical analysis, is the study of limits, continuity, derivatives, integrals, and infinite processes. It is concerned with understanding and formalizing the concepts of change and accumulation, which are fundamental in modeling real-world phenomena.

Historical Background of Analysis

The origins of analysis trace back to the 17th century with the development of calculus by Isaac Newton and Gottfried Wilhelm Leibniz. Their groundbreaking work introduced the fundamental ideas of differentiation and integration. Over time, mathematicians formalized these concepts, leading to the rigorous foundations of analysis in the 19th century, primarily through the work of Augustin-Louis Cauchy, Karl Weierstrass, and others.

Core Objectives of Analysis

- To understand the properties of functions and sequences
- To rigorously define limits, continuity, derivatives, and integrals
- To analyze the behavior of mathematical systems under various operations
- To provide tools for solving real-world problems involving change and accumulation

Branches of Analysis

Analysis is a broad field with several interconnected branches, each focusing on different aspects of mathematical concepts.

Real Analysis

Real analysis deals with real numbers and real-valued functions. It explores the properties of sequences, series, limits, continuity, differentiation, and integration in the context of real numbers.

Complex Analysis

Complex analysis studies functions of complex variables. It involves the analysis of holomorphic functions, complex integration, and conformal mappings, with applications in physics and engineering.

Differentiation

Differentiation measures how a function changes at a point. The derivative $f'(x)$ indicates the slope of the tangent line to the graph of f .

Integration

Integration accumulates quantities such as area under a curve. The definite integral $\int_a^b f(x) dx$ computes the accumulation of f from a to b .

Sequences and Series

- Sequences: Ordered lists of numbers that approach a limit.
- Series: Sum of the terms of a sequence. Convergence or divergence of series is a central topic in analysis.

Key Theorems and Principles

Several fundamental theorems form the backbone of analysis, providing tools for understanding and solving problems.

Limit Theorems

- Squeeze Theorem: If $f(x) \leq g(x) \leq h(x)$ near a point and $\lim_{x \rightarrow c} f(x) = \lim_{x \rightarrow c} h(x) = L$, then $\lim_{x \rightarrow c} g(x) = L$.

Continuity Theorems

- Intermediate Value Theorem: If f is continuous on $[a, b]$ and d is between $f(a)$ and $f(b)$, then there exists $c \in [a, b]$ such that $f(c) = d$.

Differentiation and Integration Theorems

- Mean Value Theorem: There exists some $c \in (a, b)$ such that $f'(c) = \frac{f(b) - f(a)}{b - a}$.
