Sample Trigonometric Ratios Word Problems with Answer Sheets

Problem 1: Calculating the Height of a Tree

Scenario: A surveyor stands 50 meters away from a tall tree. The angle of elevation from the surveyor's eye to the top of the tree is 30° . Find the height of the tree.

Solution:

- Step 1: Draw a diagram with the ground, the tree, and the line of sight.
- Step 2: Identify knowns: adjacent side = 50 meters, angle = 30°
- Step 3: Use tangent ratio: $\tan(30^\circ) = \text{height} / 50$
- Step 4: Calculate height: $\text{height} = 50 \tan(30^\circ)$
- Step 5: Use calculator: $\tan(30^\circ) \approx 0.577$
- Step 6: height $\approx 50 \cdot 0.577 \approx 28.85$ meters

Answer: The height of the tree is approximately 28.85 meters.

Problem 2: Finding the Distance Between Two Tall Buildings

Scenario: Two buildings are 200 meters apart. From the top of the first building, the angle of depression to the top of the second building is 45° , and the height of the first building is 150 meters. Find the height of the second building.

Solution:

- Step 1: Draw a diagram showing both buildings, the angles, and the ground.
- Step 2: Known: distance between buildings = 200 m, height of first building = 150 m, angle of depression = 45° .
- Step 3: From the top of the first building, the line of sight to the top of the second forms a right triangle.
- Step 4: Use tangent: $\tan(45^\circ) = (\text{height difference}) / 200$
- Step 5: Since $\tan(45^\circ) = 1$, height difference = $200 \cdot 1 = 200$ meters.
- Step 6: Height of the second building = height of first building + height difference = $150 + 200 = 350$ meters.

Answer: The second building is approximately 350 meters tall.

This article aims to dissect the intricacies of trigonometric ratio word problems, offering detailed explanations, strategies, and insights to help learners develop confidence and proficiency.

Introduction to Trigonometric Ratios and Their Importance

Trigonometry, a branch of mathematics focused on the relationships between angles and sides in triangles, hinges on three fundamental ratios: sine, cosine, and tangent. These ratios are essential for solving real-world problems involving angles of elevation and depression, distances, and heights.

Why Trigonometric Ratios Matter

- Practical Applications: From determining the height of a building using a protractor and measuring tape to calculating the distance across a river, trigonometry provides practical solutions.
- Educational Foundations: Mastery of these ratios is crucial for succeeding in advanced mathematics, physics, and engineering courses.
- Problem-Solving Skills: Word problems enhance analytical thinking, requiring students to translate real-world scenarios into mathematical models.

Understanding the Structure of Trigonometric Word Problems

Before diving into solutions, it is vital to understand the common components and language used in these problems.

Typical Elements of Word Problems

- Given Data: Known measurements such as angles, side lengths, or distances.
- Unknowns: What needs to be found, e.g., height, distance, or angle.
- Contextual Clues: Words like "above," "below," "across," or "angle of elevation" that hint at the involved trigonometric functions.
- Diagram: Often, a sketch or diagram helps visualize the problem, marking known and unknown quantities.

Common Types of Trigonometric Word Problems

- Height and Distance Problems: Calculating the height of a building or mountain.
- Angle of Elevation and Depression: Determining distances based on angles observed from a point.
- Navigation Problems: Finding the course or position of objects in motion.
- Surveying and Architecture: Measuring land or constructing angles for structures.

Step-by-Step Approach to Solving Trigonometric Word Problems

Successfully tackling these problems involves a systematic methodology.

- Read and Understand the Problem Carefully

- Identify what is given and what needs to be found.
- Visualize the scenario, and draw a diagram to clarify relationships.
- Label all known quantities and variables.

- Decide Which Trigonometric Ratio to Use

- Determine which sides and angles are involved.
- Recall that:
 - Sine ($\sin$) = Opposite / Hypotenuse
 - Cosine ($\cos$) = Adjacent / Hypotenuse
 - Tangent ($\tan$) = Opposite / Adjacent
- Based on the diagram, select the ratio that relates the known and unknown quantities.

- Set Up the Equation

- Write the ratio in terms of known and unknown variables.
- Incorporate any given data into the equation.

- Solve for the Unknown

- Use algebraic manipulation to isolate the unknown variable.
- Apply inverse trigonometric functions if the problem involves finding an angle.

- Verify the Solution

- Check if the answer makes sense within the context.
- Ensure units are consistent.

- Confirm that the solution respects the geometric constraints (e.g., angles between 0° and 90°).

Examples of Trigonometric Word Problems and Their Answer Sheets

To illustrate the process, consider sample problems with detailed solutions.

Example 1: Height of a Tree Using Angle of Elevation

Problem: From a point on the ground 50 meters away from the base of a tree, the angle of elevation to the top of the tree is 30° . Find the height of the tree.

Solution Steps:

- Draw a diagram: A right triangle with the ground distance (adjacent side) = 50 m, the height of the tree (opposite side) = h , and the hypotenuse connecting the observation point to the top.

- Identify knowns and unknowns:

- Adjacent side = 50 m
- Angle of elevation = 30°
- Unknown height = h

- Select the ratio:

- Use tangent because it relates opposite and adjacent sides:

$$\tan 30^\circ = \frac{h}{50}$$

- Set up the equation:

$$h = 50 \times \tan 30^\circ$$

$$h = 50 \times \tan 30^\circ$$

$$h \approx 25 \text{ m}$$

- Calculate:

\[

$$\tan 30^\circ = \frac{1}{\sqrt{3}} \approx 0.577$$

\]

\[

$$h = 50 \times 0.577 \approx 28.85 \text{ meters}$$

\]

- Final answer:

The height of the tree is approximately 28.85 meters.

Answer sheet notation:

Height of tree ? 28.85 meters.

Example 2: Distance Across a River Using Angle of Depression

Problem: An observer stands on the riverbank and measures an angle of depression of 45° to a boat directly across the river. If the observer's height above the water is 2 meters, find the width of the river.

Solution Steps:

- Draw a diagram: A right triangle with the vertical height of the observer (2 m), the horizontal distance (river width, x), and the line of sight.

- Identify knowns and unknowns:

- Vertical height = 2 m

- Angle of depression = 45°

- Unknown: width of the river = x

- Choose the ratio:

- Since the angle of depression equals the angle of elevation from the boat to the observer, and the line of sight forms a right triangle:

$$\tan 45^\circ = \frac{\text{vertical height}}{\text{distance across the river}}$$

- Set up the equation:

[

$$\tan 45^\circ = \frac{2}{x}$$

]

[

$$1 = \frac{2}{x}$$

]

[

$$x = 2$$

]

- Final answer:

The width of the river is 2 meters.

Answer sheet notation:

River width = 2 meters.
