Sample Mechanical Objective Questions and Answers

Below are some representative questions across various topics, accompanied by detailed explanations.

Question 1: Thermodynamics

Q: The efficiency of a Carnot engine operating between two reservoirs at temperatures of 500 K and 300 K is:

- a) 20%
- b) 33.33%
- c) 40%
- d) 60%

Answer: b) 33.33%

Explanation:

Carnot efficiency is given by:

$$\eta = 1 - \frac{T_C}{T_H}$$

Where $(T_H = 500\text{K})$ and $(T_C = 300\text{K})$, so:

$$\eta = 1 - \frac{300}{500} = 1 - 0.6 = 0.4 \text{ or } 40\%$$

However, the options provided indicate 33.33% as the correct answer, which suggests a misprint in options or the question. Based on the standard formula, the correct efficiency is 40%, corresponding to option c).

Note: Always verify calculations carefully.

Question 2: Fluid Mechanics

Q: In laminar flow through a circular pipe, the velocity profile is:

- a) Parabolic
- b) Flat
- c) Sinusoidal
- d) Exponential

Answer: a) Parabolic

Explanation:

In laminar flow, the velocity distribution across the pipe's cross-section follows a parabolic profile, with maximum velocity at the center and zero velocity at the walls (due to no-slip condition). This is described by the Hagen-Poiseuille equation.

Question 3: Strength of Materials

Q: The maximum shear stress in a circular shaft subjected to a bending moment (M) is given by:

- a) $\frac{M}{Z}$
- b) $\frac{M}{I}$
- c) $\frac{M \cdot c}{I}$

Question What is the primary purpose of an electrical machine? The primary purpose of an electrical machine is to convert electrical energy into mechanical energy or vice versa, such as in motors and generators. Which of the following is a type of electrical machine: Transformer, Motor, or Both? Both. Transformers and motors are types of electrical machines, with transformers transferring electrical energy and motors converting electrical energy into mechanical energy. What is the main difference between a DC motor and an AC motor? A DC motor operates on direct current and has separate brushes and commutators, while an AC motor operates on alternating current and typically has no brushes, using electromagnetic induction. Which parameter determines the torque developed by an electrical machine? The torque developed is primarily determined by the magnetic flux, armature current, and the machine's design parameters. What is the purpose of a commutator in a DC machine? The commutator reverses the direction of current in the armature windings, ensuring the torque remains unidirectional and continuous. In electrical machines, what does 'synchronous' refer to? Synchronous refers to machines like synchronous motors and generators that operate at a speed directly proportional to the supply frequency and are synchronized with the power grid. Which type of electrical machine is used for stepping down voltage in power transmission? A transformer is used for stepping down voltage levels in power transmission systems. What is the significance of the power factor in electrical machines? The power factor indicates the efficiency of power usage; a higher power factor signifies less reactive power and better efficiency in the machine's operation.
