Introduction to Internal Combustion Engines

What is an Internal Combustion Engine?

An internal combustion engine (ICE) is a type of heat engine where the combustion of fuel occurs within a confined space, producing hot gases that drive mechanical work. These engines are the backbone of most automobiles, motorcycles, and various machinery around the world. The combustion process involves burning a fuel-air mixture, typically gasoline or diesel, inside cylinders to generate power.

Types of Internal Combustion Engines

- Compression Ignition Engines (CI): Diesel engines where compression heats the air sufficiently to ignite the fuel without a spark.

Working Principle of Internal Combustion Engines

The typical cycle involves:

- Intake stroke: Air-fuel mixture enters the cylinder.

- Compression stroke: Piston compresses the mixture.
- Power stroke: Ignition causes combustion, pushing the piston down.
- Exhaust stroke: Combustion gases are expelled.
