Sample Middle School Math Olympiad Problems and Solutions

Problem 1:

Number Theory

Find all positive integers n such that $n^2 + 5n + 6$ is a perfect square.

Solution:

Rewrite the expression:

$$n^2 + 5n + 6 = (n + 2)(n + 3)$$

Set $(n + 2)(n + 3) = k^2$, where k is an integer.

Note that $(n + 2)$ and $(n + 3)$ are consecutive integers, so their product is close to $(n + 2.5)^2$.

Since the product of two consecutive integers is a perfect square only in special cases, check small values:

- For $n = 1$: $(1 + 2)(1 + 3) = 3 \times 4 = 12$, not a perfect square.
- For $n = 2$: $4 \times 5 = 20$, no.
- For $n = 7$: $9 \times 10 = 90$, no.
- For $n = 8$: $10 \times 11 = 110$, no.
- For larger n , the product increases and isn't a perfect square unless factors coincide in special ways.

Alternatively, note that for the product of two consecutive integers to be a perfect square, both must be perfect squares themselves or equal, which is impossible for consecutive integers unless at 0, which isn't positive.

Thus, there are no positive integers (n) such that $(n^2 + 5n + 6)$ is a perfect square.

Problem 2:

Geometry

In triangle (ABC) , $(AB = AC)$. The points (D) and (E) lie on (BC) such that $(BD = BE)$. If (AD) and (AE) intersect at point (F) , prove that $(BF = CF)$.

Solution Outline:

- Since $(AB = AC)$, triangle (ABC) is isosceles with (A) at the apex.
- (D) and (E) are points on (BC) with $(BD = BE)$. This symmetry suggests (D) and (E) are equidistant from some point or symmetric in position.
- The lines (AD) and (AE) intersect at (F) .
- Using properties of isosceles triangles and similar triangles, one can show (F) is the midpoint of (BC) , hence $(BF = CF)$.

This problem emphasizes symmetry and properties of isosceles triangles, typical in geometric olympiad problems.

Sample Math Olympiad Problems for 7th Grade

To illustrate the nature of these problems, here are some sample questions across different categories:

Number Theory Problem

Find the smallest positive integer that is divisible by 3, 4, and 5, but not divisible by 6.

Solution Approach:

- Find the LCM of 3, 4, and 5.
- Check divisibility constraints.

Answer:

- LCM of 3, 4, 5 = 60.
- 60 is divisible by 3, 4, 5, but not by 6 (since 6 divides 60, but the problem asks for not divisible by 6; so find a multiple of 60 that is not divisible by 6).
- The smallest such is 60 itself, but since 60 is divisible by 6, we need to find a multiple of 60 that is not divisible by 6.

Correction:

- Since 60 is divisible by 6, the initial assumption is invalid.
- The key is to find the least number divisible by 3, 4, 5, but not by 6.
- Since 6 divides 3 and 2, and 60 is divisible by 6, we look for multiples of 60 that are not divisible by 6, which is impossible because 60 is divisible by 6.
- Therefore, the question needs revision: perhaps it asks for a number divisible by 3, 4, and 5, but not by 6, which is impossible because any multiple of 60 is divisible by 6.

Final note: This example demonstrates the importance of understanding divisibility rules fully.

Algebra Problem

If $\left(x + \frac{1}{x}\right) = 5$, find the value of $\left(x^2 + \frac{1}{x^2}\right)$.

Solution:

- Square both sides: $(x + \frac{1}{x})^2 = 25$
- Expand: $x^2 + 2 + \frac{1}{x^2} = 25$
- Subtract 2: $x^2 + \frac{1}{x^2} = 23$

Answer: 23

Geometry Problem

In triangle ABC, the angles at A and B are 45° and 60° , respectively. Find the measure of angle C.

Solution:

- Sum of angles in a triangle: 180°
- $\angle C = 180^\circ - 45^\circ - 60^\circ = 75^\circ$

Answer: 75°

Combinatorics Problem

How many different 3-letter arrangements can be formed from the letters of the word "MATH" if no letter is repeated?

Solution:

- Number of arrangements: permutation of 4 letters taken 3 at a time: $P(4,3) = \frac{4!}{(4-3)!} = 4 \times 3 \times 2 = 24$

Answer: 24
