What is a Database Management System?

A Database Management System (DBMS) is software that allows users to efficiently store, retrieve, manipulate, and manage data in a structured way. It acts as an intermediary between the database and end-users or application programs, ensuring data integrity, security, and consistency.

Core Components of a DBMS

- Database Engine: Handles data storage, retrieval, and update operations.
- Database Schema: Defines the logical structure of the database.
- Query Processor: Processes database queries written in SQL or other languages.
- Transaction Management: Ensures ACID properties (Atomicity, Consistency, Isolation, Durability).
- Database Security: Protects data from unauthorized access.
- Data Integrity: Maintains accuracy and consistency of data over time.

Types of Database Models

- Hierarchical Model: Data is organized in a tree-like structure.
- Network Model: Data is represented using records and relationships.

- Relational Model: Data is stored in tables with relationships based on keys.
- Object-Oriented Model: Data is represented as objects, integrating object-oriented programming concepts.
