QuestionAnswer What are the key features of the cell membrane that are important for IB SL Topic 2? The cell membrane is a phospholipid bilayer embedded with proteins, which controls the movement of substances in and out of the cell. It is semi-permeable, allowing selective transport, and contains cholesterol for stability, as well as glycoproteins and glycolipids for cell recognition. How does facilitated diffusion differ from simple diffusion in biological systems? Facilitated diffusion involves the movement of molecules across a membrane via specific transport proteins, allowing substances that cannot diffuse freely, such as glucose or ions, to pass through. Simple diffusion occurs directly through the phospholipid bilayer and does not require proteins. Explain the role of enzymes in biological reactions covered in IB SL Biology Topic 2. Enzymes act as biological catalysts, speeding up reactions by lowering activation energy. They are specific to substrates, have an active site for binding, and are not consumed in the reaction. Enzymes are crucial for processes like digestion, respiration, and photosynthesis. What is osmosis and why is it important for cell function? Osmosis is the passive movement of water molecules across a semi-permeable membrane from a region of lower solute concentration to a higher solute concentration. It is vital for maintaining cell turgor, regulating cell volume, and ensuring proper cell function. Describe the process of active transport and give an example relevant to IB SL Biology Topic 2. Active transport involves the movement of molecules against their concentration gradient using energy from ATP, mediated by specific transport proteins. An example is the sodium-potassium pump, which maintains cell potential by moving Na^+ out and K^+ into the cell. How do surface area and volume influence cellular processes in IB SL Biology? A larger surface area relative to volume allows for more efficient exchange of materials (nutrients, waste) with the environment. As cells grow larger, the surface area-to-volume ratio decreases, which can limit the rate of transport processes and influence cell function. What are the main differences between prokaryotic and eukaryotic cells covered in IB SL Biology Topic 2? Prokaryotic cells lack membrane-bound organelles and a nucleus, and are generally smaller and simpler, like bacteria. Eukaryotic cells have a nucleus, membrane-bound organelles (e.g., mitochondria, ER), and are found in plants, animals, fungi, and protists.
