- A) It decreases
- B) It remains the same
- C) It increases proportionally
- D) It depends on the beam length

Answer: C) It increases proportionally

Analysis: The maximum bending moment in a simply supported beam with a uniform load is directly proportional to the load intensity. As the load increases, so does the maximum bending moment, which is given by the formula $M_{\max} = \frac{wL^2}{8}$, where (w) is the load per unit length and (L) is the span.
