Understanding Power System Components

Generation Stations

Power generation is the first step in the supply chain of electrical energy. Generation stations convert various forms of energy—thermal, hydro, nuclear, or renewable—into electrical power.

Types of power plants include:

- Thermal Power Plants (coal, oil, gas)
- Hydroelectric Power Plants
- Nuclear Power Plants
- Renewable Energy Sources (solar, wind, geothermal)

Transmission Lines

High-voltage transmission lines carry electricity from power plants to substations near load centers. Their primary role is to minimize energy losses during long-distance transmission.

Key features:

- High voltage levels (typically 110 kV and above)
- Use of overhead or underground cables
- Associated with transformers to step voltage levels up or down

Substations and Distribution Networks

Substations serve as nodes that step down high-voltage transmission to lower voltages suitable for distribution. Distribution networks then deliver electricity to end-users.

Components include:
