Sample DSE 2013 Biology Questions and Model Answers

Example 1: Cell Structure and Function

Question: Describe the role of mitochondria in eukaryotic cells.

Model Answer: Mitochondria are known as the "powerhouses" of the cell because they are responsible for producing adenosine triphosphate (ATP) through the process of aerobic respiration. They have a double membrane, with the inner membrane folded into cristae, which increases surface area for enzymes involved in energy production. Mitochondria also play roles in other cellular processes such as regulation of apoptosis and metabolic signaling.

Example 2: Data Interpretation

Question: Given a graph showing the rate of enzyme activity at different pH levels, identify the optimal pH and explain why enzyme activity decreases at pH levels away from this optimum.

Model Answer: The graph indicates that the enzyme exhibits maximum activity at pH 7, which is its optimal pH. Enzyme activity decreases at pH levels below or above this point because changes in pH can alter the enzyme's tertiary structure, especially the active site, affecting substrate binding and catalysis. Deviations from the optimal pH can also lead to denaturation or reduced enzyme efficiency.

Sample Question:

?Figure 1 shows a diagram of the human circulatory system. Explain how the structure of arteries and veins relates to their functions.?

Approach:

- Identify key points: Thick elastic walls in arteries to withstand high pressure; valves in veins to prevent backflow.
- Explain the relation: The structure supports their role in transporting blood away from or toward the heart.
- Use diagrams: Refer to or sketch diagrams if necessary to illustrate your points.

Sample Answer:

"Arteries have thick, elastic walls composed of muscle and elastic fibers, enabling them to withstand the high pressure generated by the heart's contractions. This structural feature allows arteries to efficiently carry oxygenated blood from the heart to various tissues. In contrast, veins have thinner walls and contain valves that prevent the backflow of blood, facilitating the return of deoxygenated blood to the heart under lower pressure. The presence of valves is particularly important in the limbs where gravity opposes blood flow."
